

UNITED STATES  
NUCLEAR REGULATORY COMMISSION  
WASHINGTON, D.C. 20585-0001

May 28, 2004

The Honorable Edward J. Markey  
United States House of Representatives  
Washington, D.C. 20515

Dear Congressman Markey:

On behalf of the U. S. Nuclear Regulatory Commission (NRC), I am responding to your letter dated April 9, 2004, in which you requested information about certain unwanted or unaccounted for self-contained irradiation devices containing radioactive cesium-137, and expressed concern for the security of these devices. These devices are discussed in a memorandum that was sent to NRC staff by Mr. Terry Devine, Conference of (State) Radiation Control Program Directors (CRCPD), on April 4, 2003. We appreciate your not releasing this memorandum publicly.

I would like to assure you that the NRC shares your concern regarding the security of high-risk radioactive sources, including the devices in question. Indeed, NRC staff over the past year and a half played a pivotal role in negotiating a revised International Atomic Energy Agency (IAEA) Code of Conduct on the Safety and Security of Radioactive Sources. Consistent with the United States Government's commitment to implement the Code of Conduct, NRC has completed an interim inventory of high-risk radioactive sources possessed by NRC or Agreement State licensees and has embarked on developing, in partnership with other agencies, a National Source Tracking System, which will provide cradle-to-grave tracking of high-risk sources (radionuclides of concern at or above the category 2 thresholds in Table 1 of the Code of Conduct). NRC staff have also contributed to the development of IAEA guidance on export and import controls on high-risk sources. The staff will send a proposed rule, requiring specific licenses for the export and import of high-risk sources, to the Commission by the end of June 2004.

With regard to the specific devices mentioned in Mr. Devine's memorandum, in 1996, NRC initiated a review to identify the location or determine the disposition of all these devices, many of which were licensed in the 1960's and 1970's. The effort was initiated as part of a larger, ongoing effort, the Formerly Terminated License (FTL) review project. The FTL review was initiated to determine whether formerly terminated licenses had been properly closed out, and all radioactive material and potential contamination had been properly accounted for and addressed. As a result, the location and disposition of nearly all the devices identified by the FTL effort was determined, and the NRC remains attentive for any new information on the status of the remaining sources. This effort involved working with the licensees who possess or previously possessed these devices, State Regulatory programs, the Department of Energy (DOE), CRCPD, and manufacturers and service companies of the devices.

Coordinated Federal and State efforts to address the unwanted devices continue. For example, NRC and DOE previously discussed potential recovery of these devices and each agreed that high-risk cesium sources should be included on the priority list for recovery. It is

our understanding that DOE is currently identifying funds to support recovery of these sources. It is also important to note that all the unwanted devices that this letter addresses are located at licensed facilities and, as such, are subject to regulatory oversight.

If you have further questions regarding this matter, please feel free to contact me.

Sincerely,

Nils J. Diaz

Enclosure: Responses to Questions

## RESPONSES TO QUESTIONS FROM CONGRESSMAN MARKEY, APRIL 9, 2004

Question 1: Has the Commission followed up on the results of this survey? If so, please describe all such activities.

Answer 1:

Yes, as part of the overall effort to locate and determine the disposition of these devices, the NRC staff followed up on the 2003 status update from the Conference of Radiation Control Program Directors (CRCPD).

During follow-up activities to the April 2003 status update, which indicated that 8 devices were not accounted for, it was determined that one licensee had incorrectly reported to the CRCPD that their device was not accounted for, and that they actually had it in their possession. Therefore, the current number of devices not accounted for is seven.

### Background

As noted in the cover letter, the effort to locate and determine the disposition of these devices was initiated in 1996 as part of the Formerly Terminated License (FTL) review project. The FTL review identified several instances where former NRC licensees who possessed these devices failed to properly transfer or dispose of the devices when the license was terminated. Given the significant quantity of material contained in these devices, the NRC staff took immediate action to determine their status, and to ensure they were properly licensed and controlled. This effort identified 134 devices that were originally licensed in the 1960's and 1970's, and found that many of these licenses had been terminated in the mid-1980's. Due to the passage of time, determining the current status of each device, and locating records of devices that had been transferred or disposed, proved to be a difficult task.

As part of this effort, the assistance of the CRCPD was requested for identifying possible outlets for unwanted devices, and for maintaining a centralized record of the status of follow-up efforts. In 2000, and again in 2003, the CRCPD performed a survey to determine which licensees no longer wanted their devices, and whether licensees had been successful in transferring or disposing of their unwanted devices. Much of the data in the CRCPD's status reports was based on information provided by the NRC or State Regulatory Agencies. Therefore, follow-up actions by the NRC to the 2000 and 2003 status reports included follow-up with licensees who indicated they no longer wanted their devices (such as amending the license when appropriate), verification of the information in the report, and providing updated information to the CRCPD when changes occurred. In addition, the NRC continued to follow-up on devices under NRC jurisdiction that could not be accounted for, including reviewing inventory and transfer records and site inspections, and contacted officials in the State Regulatory Agencies to try and determine the status of unaccounted for devices under State jurisdiction.

Question 2: Have the unwanted sources been recovered? If not, why not? If so, when?

Answer 2:

No. Based on recent discussions with the CRCPD, it does not appear that any of the 11 licensees identified in the April 2003 status update as possessing unwanted devices have

transferred or disposed of their devices. Several of the licensees previously indicated that they do not have the funds available to pay the transfer or disposal costs.

It is the responsibility of the licensee to properly disposition radioactive material when it is no longer used or wanted. Until a device is properly dispositioned, the licensee is responsible for appropriate security and control of the device. However, the NRC, Department of Energy (DOE), and CRCPD each have initiated programs for the recovery of unwanted or orphan radioactive sources under certain circumstances. For example, in instances where sources are abandoned or not being properly controlled by a licensee, the NRC can request emergency assistance from DOE to recover the sources to protect the public health and safety. Based on currently available information, we believe that all of these devices, which are located at licensed facilities and are subject to regulatory oversight, are being properly controlled by the licensees.

**Question 3:** What specifically has NRC done to identify the location of the sources that are listed as unaccounted for in the memo? If no steps have been taken, why not? How many of these sources have been located? How many have been retrieved?

**Answer 3:**

As discussed in Answer 1 above, the effort to locate or determine the disposition of these devices was initiated by the NRC staff in 1996. However, these sources were physically dispositioned between the 1960's and early 1980's, and the effort initiated in 1996 was principally an inventory and records review. For devices last located in an Agreement State, the State regulatory program staff performed the follow-up actions. Follow-up efforts included record reviews, telephone contacts, and in a few cases, site visits when appropriate. In addition, the CRCPD also provided assistance with contacting licensees and identifying possible options for the disposition of unwanted devices.

Sources of information on the location or disposition of devices included licensee inventory and transfer records, NRC and State license and inspection files, service, installation, and removal records from manufacturers and service companies, and historical recollection by individuals who had knowledge of the devices (e.g., prior employees).

As discussed in Answer 1, the current location or final disposition of these devices has been determined for 127 of the 134 devices. For the remaining 7 devices, the final disposition could not be verified. In some instances, extensive record reviews and/or site visits could identify no records available or could not verify that the device was ever possessed by the licensee. In other cases, it is uncertain whether the device actually existed (i.e., only non-specific references to a device could be found). In these instances, the status was indicated as unaccounted for, even if it is possible that the device never existed. As long as the device remains intact, it does not pose a safety hazard because the source is heavily shielded. Although we will remain attentive for any new information on these devices, it is possible that their status may never be known. All known sources that have been identified by the FTL effort are licensed and subject to inspection by either NRC or Agreement States, as applicable.

Question 4: What disposal options exist for these sources? How much does it cost the owner to commercially dispose of a device?

Answer 4:

The devices may be transferred to a licensed manufacturer or service company for possible recycling of the cesium. Information provided to the NRC staff indicates that the cost for recycling is about \$20,000-\$25,000 per device. Due to their relatively high cesium content, these sources are not generally acceptable for disposal at existing licensed commercial radioactive waste disposal sites.

Following the initiation of follow-up efforts on this issue in 1996, a service and manufacturing licensee offered to recover these unwanted devices for recycling at a reduced rate, about \$4,000-\$5,000 per device, if the NRC or CRCPD identified unwanted devices that could be consolidated geographically. To date, a significant number of these devices have been recovered in this manner by the licensee. Several of the licensees listed in the CRCPD's 2003 status memo as possessing an unwanted device were offered this recycling option, but chose not to accept the offer. The agreement with the service and manufacturing licensee for recycling of the sources is no longer in effect. However, it may be possible to negotiate a similar reduced cost option if enough licensees indicate a willingness to take advantage of such an option.

The devices are also candidates for recovery by DOE under the Offsite Source Recovery Program (see Answer 5).

Question 5: Is the DOE Offsite Source Recovery Project equipped with both the expertise and the resources to assume ownership of these materials?

Answer 5:

The DOE Offsite Source Recovery Program (OSRP) has the expertise to recover these devices, and did so in 1996 in response to an NRC emergency request after two of these devices were identified in an unlicensed location. The DOE has always been responsive to such emergency requests, which can be made under an NRC/DOE Memorandum of Understanding. Such emergency recoveries are typically performed when sources are not being maintained in a manner that provides reasonable assurance of adequate protection of public health and safety, and DOE has never refused to recover a source that the NRC determined required an emergency recovery.

As you may be aware, DOE recently transferred the OSRP from the Office of Environmental Management to the Nuclear and Radiological Threat Reduction Task Force. With this change, the OSRP now has a national security focus, and the recovery of high-risk sources is within the scope of the program. Both NRC and DOE view cesium as one of the primary radionuclides of concern, and place priority on recovering the highest risk, most vulnerable sources first. The NRC and DOE OSRP previously discussed the potential for the recovery of these devices, and agreed that the devices should be included in the priority list for recovery. DOE is currently identifying additional funds to support the revised focus of the program, including funds for the

recovery of high-risk cesium sources. The response to question 8 provides additional details on DOE's source recovery program.

Question 6: Have all these source owners received Security Advisories regarding their sources? What steps have been taken to assure that additional security measures have been implemented? Can the Commission take enforcement action against a source owner that fails to take extra security measures contained in NRC Advisories? If not, why hasn't NRC issued Orders instead?

Answer 6:

Shortly after September 11, 2001, NRC mailed a Security Advisory to all NRC materials licensees, and requested that the Agreement States provide their licensees with the same Advisory. In March and April 2003, in conjunction with Operation Liberty Shield, NRC sent Security Advisories to certain materials licensees who were authorized to possess material above certain thresholds. The NRC and Agreement States quickly gathered contact information for identified licensees, as a result of a rapid notification request from the Department of Homeland Security. Due to time constraints, the database of contact information was incomplete, and not all of the licensees contained in the CRCPD memo were notified. We have continued to update the database to ensure that, in the future, all of these licensees will receive the appropriate Security Advisories.

The security of the devices is checked during safety inspections. The Commission cannot take enforcement actions based on the Advisories alone, but will take enforcement action if an underlying security or safety requirement is violated. The Commission has issued Orders to enhance security based on risk, starting with the highest risk facilities and materials. Orders to enhance security for the types of devices discussed in the CRCPD memo are still under consideration.

Question 7: On June 23, 2004, the Commission issued Orders to require additional security measures for licensees of panoramic and underwater irradiators licensed to possess greater than 370 terrabecquerels (10,000 curies) of byproduct material in the form of sealed sources. In January 2004, the Commission also issued Orders to some materials manufacturers and distributors. However, these Orders apply only to a small sub-set of the thousands of licensees of radioactive materials in the U. S. Does the Commission plan to promulgate regulations or issue Orders to other licensees of these materials? If so, when, and for which licensees? If not, why not?

Answer 7:

As discussed in the response to Question 6, above, the Commission has been upgrading security requirements based on risk, starting with the highest risk facilities and materials. Security enhancements for other types of licensees possessing high-risk radioactive materials (category 2 and higher quantities of radionuclides identified in the IAEA Code of Conduct, Table 1) are under consideration by a joint NRC-Agreement State Materials Security Working Group (MSWG). The MSWG is recommending a phased approach to the remaining classes of

licensees, which, on the basis of the NRC's initial inventory, number less than 1800. The Commission expects to make decisions on what further actions to take for all remaining classes of licensees possessing high-risk radioactive material in the near term. The next group of licensees the MSWG expects to address would include the Gammator licensees.

- Question 8: There are other types of radioactive devices that contain large quantities of cesium, cobalt-60, and radium that are also unwanted or unaccounted for.
- a) What have you done to ascertain the status of these materials?
  - b) Please provide a list of each source of cesium-137, cobalt, and radium that has been reported missing, unwanted, or are otherwise cannot be accounted for in the last 5 years. Please include the name and location of the licensee, the activity of each source, any step NRC has taken to locate and secure these materials, and the resolution of the matter, if any.
  - c) How would the owners of unwanted materials go about disposing of them?
  - d) How much does it cost to dispose of these materials?

Answer 8:

A list of the sources reported lost, stolen, missing or found and entered into the NRC Nuclear Materials Event Database (NMED) is provided in the Attachment. As discussed above, the unwanted cesium devices were identified as part of a specific NRC initiative.

When a source is reported lost, stolen or missing, NRC and the Agreement State agencies require licensees to make reasonable efforts to recover it. This often includes notification of local media and law enforcement authorities. Many sources are recovered through these efforts. For a large source, State agencies might assist licensees directly in a physical search using radiation detection instruments, and may request Federal assistance with the search. Thirty days after reporting a lost, stolen, or missing source, licensees are required to notify the NRC or appropriate Agreement State, in writing, of the current status of the recovery effort. If the device has been found, the status report will so indicate. However, after submitting this status report, there is no requirement to update the NMED data base if the source is subsequently located. Some licensees have reported to NMED if a source is subsequently recovered, while others have not made such reports. Please note that NRC does not have authority to regulate radium sources (although we have requested such authority from the Congress); they are regulated by the States. Although NRC allows reports of radium losses to be entered into NMED, entering this information into NMED is voluntary and some radium losses might not have been reported. Licensees are not required to report unwanted sources.

In the last 5 years, 437 cobalt or cesium sources have been reported either lost, stolen, missing or found. Of those reported lost, stolen or missing, 285 were subsequently reported as recovered. Other sources may also have been recovered, but because recoveries are not required to also be reported, the information on recoveries in NMED may not be complete. Most of the reports involved portable gauges, which contain about 10 millicuries of cesium (296 reported lost or stolen, 175 reported recovered). No sources containing more than 2 curies of cesium were reported lost or stolen, and the largest unrecovered source contained 0.75 curie of cesium. All of these are far below the IAEA Code of Conduct's category 2 threshold of 30 curies for cesium export/import controls and national cradle-to-grave control for cesium sources.

Of the 109 reports involving radium, only one source has not yet been recovered. The 5 millicurie activity of this source is far below the IAEA Code of Conduct's category 2 threshold of 10 curies for radium. Many radium reports involve "found" radium at landfills and scrap metal dealers. The radioactive material often is determined to be small luminescent sources or a natural accumulation of radium contamination (e.g., from dirt).

In order to improve accountability of high-risk radioactive sources, the NRC is working with the States and several Federal agencies to develop a National Source Tracking System. As a first step, NRC has initiated an interim national inventory of radioactive sources above specified thresholds of curie content consistent with the IAEA Code of Conduct. The interim inventory and National Source Tracking System will improve accountability and, over time, should improve security and reduce losses.

Owners of unwanted materials generally must pay to have them transferred to an authorized recipient for reuse, recycling, or disposal at a radioactive waste disposal site. There are radioactive waste service companies that can arrange recycling or disposal. Commercial recycling/disposal can cost tens of thousands of dollars or more, which is a hardship for some licensees.

In September 2001, the NRC provided a grant to the CRCPD to establish a program providing assistance to licensees possessing unwanted radioactive sources, and to States responding to incidents involving lost, abandoned, or found radioactive materials. This program was developed through a cooperative effort involving NRC, DOE, EPA, State, and industry representatives, and is led by the CRCPD. This program has established a web site ([www.CRCPD.org/orphans.asp](http://www.CRCPD.org/orphans.asp)) that provides information on Federal assistance programs (e.g., the DOE OSRP), potential commercial outlets for unwanted radioactive materials (e.g., recycling programs, waste brokers, and manufacturers and distributors willing to take back sources), and training and assistance available to State and Federal personnel responsible for responding to lost source incidents. The assistance available to States also includes provisions for providing funding for the proper disposition of orphan sources identified in the States. Under this program, the CRCPD has established assistance agreements with 11 States, and has provided funding to the States 8 times to provide for the proper disposition of a total of 130 orphan or unwanted sources.

Under an NRC/DOE Memorandum of Understanding, the NRC has requested emergency assistance from the DOE Offsite Source Recovery Program (OSRP) over 20 times, involving over 500 sources. Under this agreement, the NRC can request emergency assistance from the DOE where radioactive material has been abandoned or is at high risk of becoming abandoned due to problems with the licensee (such as a licensee bankruptcy).

Under the DOE OSRP, the DOE has recovered over 9,500 unwanted or orphan sources, many of which would be category 2 and above sources under the IAEA Code of Conduct. These recoveries have been performed in response to requests from NRC and to licensees who have registered their unwanted sources though the OSRP web site (<http://www.doeal.gov/osrp>). Following the terrorist attacks on New York and Washington on September 11, 2001, the NRC and DOE accelerated and focused their efforts to identify and recover radioactive sources in the US that could pose a risk for use in a "dirty bomb." This accelerated recovery effort resulted in over 5,500 of these at-risk sources being recovered over the 18-month period that ended in March 2004.
